right. 'And,' Sammy asked, 'isn't that the case for my mathematics?'" (Freyd in [**6**, p. 1350]).

Mac Lane called his collaboration with Eilenberg "one small, but typical, example of East meets West. The great influx of refugee mathematicians from Europe presented a decisive stimulus for American mathematics in the 1940s" [**33**, p. 347]. The Eilenberg-Mac Lane collaboration not only brought together algebra and topology; it epitomized the cross-fertilization of different mathematical schools and the breaking down of internal disciplinary barriers within mathematics in the second half of the twentieth century.
